THE POWERFUL IAM

Empower IAM to Serve your Business Needs with **TrustBuilder Identity Hub**

The digital world we're living in requires a new style of IAM, flexible enough to quickly adapt to ever changing requirements, without impacting the applications infrastructure in use. Allow internal and external users seamless access to local, mobile and Cloud services from multiple devices, using IDs and credentials from various sources.

Consumers are increasingly using their social IDs to access services and resources. You need to be able to reach your users through any platform and allow them easy access to your services through their existing digital identities.

TrustBuilder Identity Hub is purposely designed to meet today's demands for an agile approach to web and API access management. A policy based approach is what organizations need to quickly and easily adapt the behavior of the IAM platform and accommodate change. Runtime decisions are based on such policies and information obtained in real time from various sources, both for Authentication as well as Authorization.
